

400G Optical Modules for Backbone Networks to Resist Electrocution

Overview

A 400G optical module performs photoelectric conversion: With a 400 Gbps transmission rate, these modules support industry evolution from 100M → 1G → 25G → 40G → 100G → 400G → 1T. They form the backbone of high-throughput data center networks and AI clusters. From cloud data centers to metro and long-haul networks, 400G—particularly coherent variants like ZR and ZR+—is helping eliminate bandwidth bottlenecks and support the growing demands of AI, big data, and next-generation digital services. Every layer of the data-center ecosystem, from cabling to orchestration, must evolve to sustain modern workloads. The electrical signal is converted into an optical signal at the transmitter, which then travels through fiber optics, and is converted back to an electrical signal at the receiver. With a transmission rate of 400G, the 400G. Each 400G module type begins with a two-letter prefix that indicates its typical transmission distance and the type of fiber it is designed for. These prefixes follow a consistent logic: -VR (Very-Short-Reach) — Ultra-short distances, typically within 30–50 m over MMF. What standards and packaging types. Ciena's WaveLogic 6 Extreme 1.
