

Bandwidth Selection for Core Switches

Overview

Here are key factors to consider: Port Type, Rate, and Quantity Evaluate the required port types, speeds, and quantities based on your existing aggregation layer switch. Switching capacity, sometimes referred to as "backplane bandwidth," represents the total amount of data a switch can process through all of its ports at any given time. It's measured in gigabits per second (Gbps) or terabits per second (Tbps). If budget permits, opt for a core switch with diverse port types and a higher number of ports. For instance, a switch equipped. The distribution you can use Cat 9400 or Cat 9600 (again as Collapsed Core - to save cost) Since the high volume of access switches, I suggest having modular distribution or collapsed core here. Nevertheless, not all devices.
