

Bend radius of fiber optic connection within the duct

Overview

The normal recommendation for fiber optic cable is the minimum bend radius under tension during pulling is 20 times the diameter of the cable (d). Damage may not always be obvious, like a kink in the cable, but may include broken fibers, fibers with higher loss due to stress and cable structural damage that may lead to reliability problems. 9 in (177 mm) Minimum Working Bend Radius = 6. Proper bend radius control ensures the integrity of optical performance and protects the glass. The fiber optic bend radius refers to the smallest radius a fiber cable can be bent without causing unacceptable signal degradation or physical damage. It is measured from the inside of the bend, not the outer curve. While installers are aware of the fundamental importance of minimum bend radii, they often lack the practical know-how to. The bend radius of fiber cables is critical for maintaining high performance and longevity.
