

Can fiber optic cables be used to connect devices in series

Overview

A fiber-optic switch allows you to connect two or more fiber-optic cables to form a network. These can behave like a typical Ethernet switch. As they do not emit electromagnetic signals, they're difficult to tap and secure against eavesdropping. Fiber-optic communication is a form of optical communication for transmitting information from one place to another by sending pulses of infrared or visible light through an optical fiber. The light is a form of carrier wave that is modulated to carry information. Fiber is preferred. Therefore, serial-to-fiber optic converter (also called serial-to-fiber optic modem) is the best solution to overcome these problems and extend the reach of your serial communications. Vendors also refer to this as "structured cabling", data-voice cabling, low-voltage cabling and.

Fiber-optic communication

OverviewTechnologyBackgroundApplicationsHistoryParametersComparison with electrical transmissionGoverning standards

Modern fiber-optic communication systems generally include optical transmitters that convert electrical signals into optical signals, optical fiber cables to carry the signal, optical amplifiers, and optical receivers to convert the signal back into an electrical signal. The information transmitted is typically digital information generated by computers or telephone systems.
