

Communication Tower Project Objectives

Overview

Objectives • Basic study on contracting procedures, quality, cost, time, and productivity issues in telecom tower construction industry. • Suggesting productivity improvement methods using logistics in terms of supply chain management and process mapping of the whole. Telecom infrastructure refers to the physical components that make up a telecommunications network, including the equipment, cables, towers, and other structures that enable the transmission of data and communication signals. It identifies key issues with current construction practices such as poor quality, cost overruns, and delays. Utilities require. orce of wind load that coming from one direction. There will be two models of square-foot towers of 45m and 76m tall where both to ers will be analyzed by using STAAD Pro software. This comparison is to find out. Telecom tower lifecycle management is a comprehensive approach to managing a tower asset.
