

Depth of lightning protection grounding for distribution boxes

Overview

Typically, lightning grounding systems are driven vertically into the ground to a depth of 10 feet. Special accommodations are necessary for shallow, sandy, or rocky soil or in unusual projects such as watercraft . Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. This helps to reduce the potential difference that exists between conductive parts and the earth. IN ELECTRICAL STATIONS INCLUDING TRANSMISSION AND DISTRIBUTION SUBSTAT GR THAN 8 FT FROM THE FENCE. THE FENCE SHALL BE GROUNDED SEPARATELY FROM THE GRID UNLESS OTHERWISE NOTED ON THE A PROPRIATE PROJECT DRAWING. SEE APPLICATION. In this workshop, we will demystify the concepts of grounding as applicable to utility networks and industrial plant distribution systems as well as their associated control equipment. In fact, a lot of myths have been built around this subject, although it is quite a simple one when approached. This section at the ZANDZ website is intended for the specialists engaged in design and estimates of grounding and lightning protection systems for various facilities. The section contains useful information, recommendations, examples of typical designs in PDF and DWG, and total scopes of work to.
