

Do computing servers need optical modules

Overview

Servers are usually equipped with optical modules for network connectivity and data transmission. From a system architecture standpoint, optical. We often receive inquiries from customers asking if we have optical modules compatible with certain servers; on such occasions, our sales or FAE colleagues will always follow up with a question: which manufacturer's network adapter is used in the server?

Some customers are confused about this—they. We always go copper for short, optical for longer runs. Yes by optical I. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
