

Does PoE require a core switch

Overview

Requires PoE-compatible hardware: To power devices directly, you need a PoE or PoE+ switch, or you must add a PoE injector for non-PoE switches. (See graphic above) Distance limitations: Standard Ethernet cables can carry power and data up to about 100 meters (328. Choosing the right PoE implementation (switch vs injector) and power class/standard for your needs requires a proper understanding of the technology's capabilities and limitations. Careful planning is necessary to ensure adequate power delivery and to mitigate potential issues associated with a. The short answer is it depends. If the network design dictates that it is not a necessity and if needed there are plans to put POE capable access/distribution switches in the same area as the cores then there may be cost savings in both hardware and power requirements. That all depends on what you run. A network core switch should probably not need POE functions but end user switches and/or VOIP switches should have that ability. PoE switches provide a stable and reliable network experience through wired connections, avoiding the interference issues of wireless signals.
