

Enclosure of the main distribution box

Overview

The enclosure of a distribution box is like its outer shell, designed to protect the internal components. It's typically made of either plastic or metal. The choice of material is important because it ensures durability and safety. The hub distributes electrical power from a single input source to various circuits throughout a building. Whether it's a home, office, or factory, the DB box makes sure power. Power Distribution Equipment is a term generally used to describe any apparatus used for the generation, transmission, distribution, or control of electrical energy. It receives power from the main electrical supply and divides it into separate circuits, each. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. A distribution box is a key part of electrical systems in buildings.
