

Fiber optic belt

Overview

Fiber Optical Cable Belts are key components used to haul and pull fiber optic cables during installation. It is usually used in conjunction with the fiber optic cable traction machine to ensure that the fiber optic cable is pulled smoothly and evenly during the laying process to avoid uneven force. Luna's Distributed Fiber Optic Sensing (DFOS) solution emerges as a game-changer in monitoring these crucial systems. Early Warning of Overheating: Luna's fiber optic sensing provides early detection of hotspots or overheating along the conveyor belt. If action is taken during this phase, then any fire suppression or cooling measures are much more likely to be effective. Fiber optic sensing technology uses the principle of light reflection to detect changes in the physical properties of the conveyor belt, such as strain, temperature.
