

Fit-on small pins for optical modules

Overview

The small form factor pluggable (SFP) connector is designed to connect directly to modules that interface with copper or fiber. These are generally used with fiber links in the data center, although these links are now being found elsewhere as I mentioned above. A constant trend in optical modules is to offer higher data rates within the size-limited and thermally-limited form factor by using smaller, integrated Power and Data-Converter solutions. A single miswire or mismatched connector can bring down entire systems, which can cost. An optical pin is a precision-engineered component used in optical systems to ensure accurate alignment, calibration, and functionality of various instruments. Think of it as the “translator” for your network equipment, converting electrical signals into optical signals.
