

Function of the grounding electrode in the distribution box

Overview

Grounding Electrodes: Grounding electrodes, which can be rods or plates, are inserted at regular intervals along the cable route in order to offer additional grounding routes. **Safety of Personnel:** By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. This helps to reduce the potential difference that exists between conductive parts and the earth. From NEC Consultant Mike Holt's recent 12-part series on the differences between bonding and grounding to Electrical Training Consultant Randy Barnett's webinar and Tech Talk on the subject, our readers can't seem to get enough of this important topic. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used.
