

Grounding resistance during installation of optical distribution boxes

Overview

Take reasonable measures to ensure that the resistance to ground is 25 ohms or less for typical loads. This Applications Engineering Note (AE Note) discusses conventional bonding and grounding practices for conductive fiber optic cable and hardware installations within the scope of the National Electrical Code (NEC). However, component design should also take account of future requirements to extend operating wavelength to 1675nm. Suppliers shall provide information on the likely change in performance efficiently handled and. Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical insights into proper grounding techniques, with a special focus on how selecting quality materials from a reliable building material supplier impacts your entire system's safety and longevity.

Grounding and bonding are the basis upon which safety and power quality are built. One way to coordinate these efforts is to follow. However, be aware that a proper operation of the system is only possible, if all of the applied network components, as for example routers/PoE switches, cables, network cabinets and end-user devices, are correctly installed in the overall system.
