

How much does a cloud-connected data center cost

Overview

Costs range from roughly \$10 million for smaller builds to over \$1 billion for hyperscale facilities. The final number depends on power density, redundancy requirements, and market conditions. Size is important, but design choices and execution discipline shape the true. Our research shows that by 2030, data centers are projected to require \$6. 7 trillion worldwide to keep pace with the demand for compute power. 2 trillion in capital expenditures, while those powering traditional IT. While construction costs for traditional cloud data centres have broadly stabilised – it is a different story for data centres designed to support AI workloads, where the cost variables are wide and extensive global benchmark data is not yet available. Electricity accounts for 40% to 60% of total operational costs, making energy efficiency and power usage optimization a financial imperative. Data center pricing varies widely depending on the type of service, the amount of space required, power draw, and contract length, but understanding the key pricing models helps businesses budget accurately. After 10 years, building is 12. Before we unpack the line items and benchmarks, it's worth grounding the conversation in one question every operator asks first: what does it actually cost to build one?
