

How to check the version number of a fiber optic switch

Overview

Cisco IOS provides several useful CLI commands for viewing SFP information. The following table summarizes the most common ones. Lists all detected hardware, including installed SFPs — displays Product ID (PID), Version ID (VID), and Serial Number. For network engineers, knowing how to view and interpret SFP information from the Cisco command-line interface (CLI) is essential. By checking module health, compatibility, and digital diagnostics, you can quickly confirm correct installation, detect optical problems, and maintain accurate hardware. These commands give you general details about your switch, like the software it is running, how long it has been powered on, and what hardware is installed. `show version` Shows the current active configuration that is. Small Form-Factor Pluggable (SFP) modules are essential transceivers used in Cisco switches and routers to connect devices via fiber or copper cables. Displays environmental status (temperature. To check the details of an SFP module in Red Hat Enterprise Linux (RHEL), you can use the `ethtool` command. Replace with the name of your network interface (e., `eth0`, `eth1`): For Example: Identifier : `0x03`.
