

How to demagnetize a distribution box

Overview

Heat treatment demagnetization involves heating the material above its Curie temperature, transforming it from a ferromagnetic to a paramagnetic state, thereby eliminating its magnetism. This method is suitable for workpieces that can withstand high temperatures. Learn the correct tools and procedures for safety. For industrial steels it is about 500°C to 800°C and initiates conversion from Ferromagnetism to Paramagnetism) This demagnetization technique is. Demagnetization can be done by applying the rated voltage at rated frequency, or a reduced voltage at reduced frequency can be used as an alternative. By gradually reducing the voltage, the core is being. Find out with us what the best and most suitable demagnetization solution for your needs.
