

How to expand the capacity of a mobile fiber optic splitter

Overview

Large-scale splitting involves splitting a single input beam into a large number of output beams, thereby increasing the capacity of the network. Find out more about how you can use optical splitters to simplify the process of expanding fiber optic networks, making it more efficient and cost-effective. 1x32 splits were common in North America for G-PON architectures. As XGS-PON continues to be adopted, some service. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. This structure eliminates the need for powered elements in the distribution segment, reducing operational costs while ensuring high.
