

Huawei CE Fiber Optic Switch Stacking

Overview

This guide dives into best practices for deploying Huawei switch stacks and provides actionable troubleshooting steps for common issues. This document describes the best practices for stack deployment, including device selection, deployment, networking deployment. Switch stacking is the process of combining multiple switches into a logical device that participates in data forwarding as a whole, in order to expand the number of ports, simplify networking, increase reliability, and extend the system's processing power and bandwidth. Moduletek Labs takes Huawei. This document describes the principles and configurations of the Device Management features, and provides configuration examples of these features. Stacking refers to the combination of multiple switches, virtualized into a swap device. By switch stacking, network high reliability and network big data quantity forwarding can be achieved, simplifying network management. If the.
