

Installation Method for Heat Dissipation of Distribution Box

Overview

The first is natural cooling, through rational design of cooling fins and vents, using natural convection to discharge heat from the distribution box. The service life of these components is halved, and the failure rate is doubled in the event of a 10 K temperature increase relative to the maximum per posed to be “air tight”. For an enclosure that has cooling accessories installed, heat losses can be dissipated thr. The following are several common cooling methods for distribution boxes: Natural heat dissipation: The casing of the distribution box is usually made of metal material, which can dissipate heat by natural convection by increasing the heat sink or cooling holes of the casing. In order to. Ensure safe placement: install in dry, accessible areas with good ventilation and at appropriate height (typically ~1.
