

Is the high voltage cable or the fiber optic cable

Overview

Fiber optic cables are strands of glass or plastic that transmit data as pulses of light. These cables are used mainly for digital audio connections between devices. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry. The integration of fiber optic technology into high voltage (HV) cables represents a significant advancement in power transmission and monitoring. This innovative approach combines the robust electrical conductivity of traditional HV cables with the unparalleled data transmission capabilities of fiber optics. In a high voltage environment, with typical line voltages of 115 kV or more, requires the evaluation of certain critical parameters. They have a unique construction that allows them to be installed on existing power line towers or poles without the need for additional hardware or supports.
