

Laying optical cables by traction

Overview

The pulling length of the optical cable at one time should generally be less than 1000m. When the distance is exceeded, segmental traction or auxiliary traction should be added at the middle position to reduce cable tension and improve construction efficiency. Minimize mechanical pressure on the outer sheath at crossing points: (armoured) cables crossing each other generate points of high pressure, so it is important when laying in figure 8 loops it is done in a correct way. Project success depends on careful planning, precise installation practices, and proper. The objective of this document is to be an optical fibre cable installation and laying guide, addressed to new installers, also being useful as a reminder to experienced installers. We should always consider the restrictions established by different administrations related to this matter.
