Electrical busbar systems (sometimes simply referred to as busbar systems) are a modular approach to electrical wiring, where instead of a standard cable wiring to every single electrical device, the electrical devices are mounted onto an adapter which is directly fitted. A busbar is a metallic strip or bar, typically made from copper or aluminum, that conducts electricity within a switchboard, distribution board, substation, or other electrical apparatus. Its primary function is to distribute power from incoming feeders to outgoing feeders. The. Traditional panel wiring systems — referred to as block-and-cable systems — are designed around large power distribution blocks (PDBs) that require large parallel cables. Each PDB feeds a specific part of the control panel, which, as enclosures continue to require more power in service of. Assemble the busbar connection while installing each cubicle. The busbar shims and hardware bag in the cubicle packaging. Refer to Access to the Busbar Compartments.
