

Method of using power lines to carry optical cables

Overview

Besides traditional cables lashed to messengers, figure-8 cables or ADSS cables, utilities can construct transmission links using optical ground wire (OPGW) or optical power phase conductor (OPPC), cables which include both fiber and metallic conductors, or. Could someone knowledgeable explain why fiber optics could or could not be used for power transmission large or small?

The formula for power in optical fiber is shown below. X is photons per second, λ is wavelength, light speed is c (speed of light is reduced significantly in fiber ~30%. Most aerial fiber optic cables are installed by lashing to a steel messenger wire strung between poles, but there is a category of cables with special high-strength jacket designs called all-dielectric self-supporting (ADSS) cables. Obviously, these fiber cables need to be resistant to electricity, which can be difficult as many aerial cables contain high tensile steel (HTS) for tensile strength. An overhead power line is a structure used in electric power transmission and distribution to transmit electrical energy along large distances. It consists of one or more conductors (commonly multiples of three) suspended by towers or poles. To improve the reliability of the supply power system, POF technique can eliminate the energy sup...
