

Optical module temperature rises rapidly

Overview

General optical module operating temperature increases, will lead to a reduction in optical power, APC (optical power automatic control circuit) will maintain the stability of the optical module optical power, but if the temperature continues to rise, the APC will. General optical module operating temperature increases, will lead to a reduction in optical power, APC (optical power automatic control circuit) will maintain the stability of the optical module optical power, but if the temperature continues to rise, the APC will. The working temperature of the optical module has a greater impact on the use of optical modules, if the working temperature of the optical module is too high or too low, there will generally be a decline in optical power, low sensitivity, poor eye diagrams, in addition to accelerating the aging of. High temperature impacts several internal parts in different ways: Laser diodes (DFB, VCSEL): Output power and wavelength shift with temperature. Excess heat can push the laser outside its optimal wavelength and reduce optical power. Photodiodes & TIA (receiver): Thermal noise increases, reducing. Why does the temperature of the optical module rise?

Is the optical module selected correctly?

According to the working temperature, optical modules can be divided into commercial grade and industrial grade, among which commercial grade optical modules are most widely used. But in fact, different. Generally speaking, a brand-new optical module will not have any major problems during short-term use. This article will discuss the impact of temperature on the use of.
