

Photovoltaic SVG power module voltage

Overview

Enjoypowers SVG supports multiple voltage levels, including 200V, 400V, 480V, 690V, and 800V, ensuring seamless integration across diverse electrical systems. dely used in photovoltaic power stations. However, because the output power of PV systems will be affected by factors such as weather and temperature, resulting in changes in the active power output to the grid connection point, the reactive power adjustment of the system is required to stabiliz. When the load is generating inductive or capacitive current, it makes load current lagging or leading the voltage. While functional, this approach introduced complexity and higher costs. Strong Power has developed a more efficient and cost-effective solution: a. SVG, or Static Var Generator, is a device used for reactive power compensation and voltage regulation.
