

Plastic Single-Mode Optical Fiber

Overview

at and Yasuhiro Koike, a polymer scientist at pioneered. Plastic optical fiber (POF) or polymer optical fiber is an optical fiber that is made out of polymer. Similar to glass optical fiber, POF transmits light (for illumination or data) through the core of the fiber. Its chief advantage over the glass product, other aspect being equal, is its robustness under bending and stretching. Materials Traditionally, (acrylic) comprises the core (96% of the cross section in a fiber 1mm in diameter), and fluorinated polymers are the material. Since the late 1990s much higher performance graded-index (GI-P. POF has been called the "consumer" optical fiber because the fiber and associated optical links, connectors, and installation are all inexpensive. Due to the attenuation and distortion characteristics of PMMA fiber. Optical fiber used in telecommunications is governed by European Standards EN 60793-2-40-2011. Several standardization bodies at country, European, and worldwide levels are currently d. • C.M.Okonkwo, E. Tangdionga, H. Yang, D. Visani, S. Loquai, R. Kruglov, B. Charbonnier, M. Ouzzif, I.
