

PoE Switch Calculation Method

Overview

The calculation is simple: list every PoE device, note its peak power usage, sum those values, and add a safety margin. If the result is, for example, 150W, you need a switch with at least 150W total PoE power. Factoring in future expansion is also wise. This tool checks if your PoE switch can power a given number of devices (e. To do that, you have to consider the device as a whole, the ports available, and the devices that you want powered when they connect to your power sourcing equipment. Accurate PoE planning requires: Ignoring physical-layer electrical losses can result in: PoE budgeting is electrical engineering - not guesswork. Longer runs increase resistance, which raises loss between the power source. To calculate your PoE power budget, add up every device's maximum power requirement, then pick a PoE switch that can supply enough wattage for all of them at once.
