

Preventing optical cable from rotating

Overview

The recommendation to use an ARD is to allow the cable to be installed without introducing torsion stress. We do so appreciate your efforts. as we expected, Slingco continues to keep the bar high when it comes to. Operators that are familiar with electronic components and wiring may not be aware of the special needs of optical fibers and fiber optical rotary joints (FORJs). As most optical fibers consist of glass, which is known to be brittle, proper handling of optical fibers is required to prevent fiber. The use of an Anti-Rotational Device (ARD), also referred to in the field as a “gator” or “monkey tail”, is common for many Optical Ground Wire (OPGW) installations which differs from installation of traditional conductor or shield wire.
