

Proper method for hanging optical fiber cables

Overview

Vertical cables are preferably installed by dropping the cable down rather than pulling them up, using proper hangers and service loops to prevent stressing cables. SANs or storage area networks in data centers are another popular fiber application. Where reels are supplied with protective material fitted over the cable, the protection should remain in place until the cable will be installed. During installation, all curvatures should be smooth. Use fiber optic cable lubricant. Outdoor cable may be direct buried, pulled or blown into conduit or innerduct, or installed aerially between poles. Indoor cables can be installed in raceways, cable trays above ceilings or under. This beginner-friendly guide will walk you through the step-by-step process of fiber optic cable installation for each method, highlighting best practices, tools, and considerations.
