

Spacing of inlet holes in distribution boxes

Overview

Distribution boxes are typically made of polyethylene or reinforced concrete with plumbing “knock outs” into the box. The inlet must be higher than the outlets, with all outlets at the same level. Distribution and dosing devices include distribution boxes, flow splitters, siphons, pumps and other flow diversion devices. They shall provide sufficient volume to accommodate expected flows. Components reviewed include septic tank outlet lines, effluent distribution lines, distribution boxes, gravity flow, pressure distribution. A distribution box — commonly abbreviated as a D-box — is a concrete, plastic, or fiberglass chamber positioned between a septic tank and a drain field to divide clarified effluent into equal flows across multiple leach lines. They also are recommended for use in sandy soils to ensure adequate treatment of wastewater. Recognizing this opportunity, eDART, an engineering company specializing in slurry valves, has added this crucial piece of process equipment to its product offering. With the use of advanced tools like Computational Fluid Dynamics (CFD), eDART has successfully. The septic tank (a settling and decomposition chamber) allows the sewage solids to separate from the liquid, undergo partial decomposition, and be stored as sludge at the bottom of the tank or floating scum at the top of the tank.
