Especially, the light coupling between optical fibers and integrated waveguide structures provides essential input-output interfaces for photonic integrated circuits (PICs) and plays a crucial role in reliable optical signal transport for a number of applications, such as optical. It involves the transfer of power between different circuit components, the split or combination of power from multiple locations, and (de)multiplexing of signals with varying frequencies. The objective of this paper is to provide a review of the theory, techniques, and applications of optical. Optical couplers are passive devices that couple light through waveguides or fibers. Optical couplers are used in many different ways. The FBT coupler is fabricated by fusing two or more optical fibers together and then tapering the fused region to create a coupling region.
