Since its first edition in 1994, the 607 standard has grown increasingly comprehensive and useful for grounding and bonding telecommunications systems. By Cindy Montstream, Legrand North America Beginning in August, 1994 with its first publication, TIA's 607 bonding and grounding standard has come. Bonding (or grounding) is a system of protective measures, which is implemented to prevent electric shocks when touching metal parts of energy-powered equipment. The whole structure consists of a metal circuit, a protect bus, and a ground wire. Network hardware is connected to PDUs and constantly. Below is a comprehensive guide for implementing effective bonding and grounding systems in data centers. It should include the following components: Supplementary. Protective Earthing is a requirement to divert unwanted, potentially hazardous currents from all exposed metallic parts such as equipment chassis, racks, cabinets, cable trays, conduit, and patch panels for personnel safety reasons and to avoid potential damage to equipment. Because low frequency. Grounding in a serve...
