

Standard three-level distribution box model

Overview

The system includes a main distribution box, sub-distribution boxes, and switch boxes connected to electrical equipment, forming a three-tiered distribution. In a newly constructed residential area, a 10kV power line is introduced into the substation. After stepping down the voltage through the transformer's low-voltage side (0.4kV), power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary. To meet all specifications (practices, speed of implementation, ease of maintenance, continuity of service, etc.). All these solutions integrate perfectly with the Legrand. The complete set of products can form a complete three-level protection system for construction electricity, achieving the goal of one machine, one switch, and one protection, which is very suitable for various standard engineering applications. As per Section-42 of Electricity Act 2003, it is the responsibility of the respective DISCOM to develop and maintain an efficient, coordinated and economical distribution system in its area of supply, hence, DISCOMs are required to install adequate. 4 KV Substation of the ratings indicated above. The body of the boxes shall have sufficient re-enforcement with suitable size of channels keeping a provision for fixing and conforming to general.
