

Straight-line tension of optical cable

Overview

Most fiber optic cable is designed to conservatively allow a maximum of 1800 N-4500 N (400 lbf-1000 lbf) of pulling tension during installation. On the other hand, it is desirable to install the longest lengths of uninterrupted cable possible. A dielectric aramid yarn is used, typically by stranding it around the optical fiber cable core, providing the necessary tensile strength for aerial applications. Additional terms used with respect to aerial installation are listed below for clarification and understanding: Span length - The. Excessive tension, bending, or sidewall bearing pressure on fiber optic cables during installation can cause microfractures in the fibers. The full primer on this topic is linked to this article. Any cable attached between two structures will hang between these two structures following a catenary curve. Dig-ups dominate! Cablers have very little influence on the majority of causes of cable field failures. The length of the looetubes and their. ITU-T has been active in the standardization of optical communications technology and the techniques for its optimal application within networks from the infancy of this industry.
