

The distribution box uses an aluminum core

Overview

Portable distribution boxes are mainly composed of core components such as shells, circuit breakers, sockets, terminals, leakage protectors, fuses, etc. As a protective "armor", the shell is mostly made of high-strength engineering plastics or aluminum alloys. It has the characteristics of light. Copper and aluminum busbars look similar, but their real-world performance in switchgear, load centers, and electrical distribution boards is completely different. Today, electrical systems are essential for homes and industries. But what exactly is a power distribution box, and why is it so essential in our daily lives?

The DB panel board controls the flow of electricity. These boxes house various circuit breakers.
