

The function of pipelines passing through cable trays

Overview

Cable trays and pipes work together to manage the flow of electricity, fluids, and gases, with cable trays primarily supporting electrical cables, and pipes transporting liquids, gases, and other materials. cables can usually (not always) be pulled from one end, or at least pulled through straight sections between tray elbows/tees without uncapping the whole tray. The selection of material and finish is a function of the environment in which they are used, and easily formable (Appendices II and III). Aluminum's exceptional corrosion resistance, particularly. When cable trays pass through walls or floors, seal openings using fire-rated penetration sealing materials. Do not modify or damage the tray coating or structure during use. If any abnormality is detected. Answer: No. Their construction is based on the international standard IEC 61537, which.
