

The high-voltage switchgear is connected by a busbar bridge

Overview

The busbar is made of metal material. The function of the busbar bridge is to fix the busbar inside, and to support, fix, protect, and dissipate heat. The starting point for planning a switchgear installation is its single line diagram. Functionally, it serves as a junction where inflowing and outflowing currents converge, acting as a central hub for power aggregation and. This article provides a comprehensive overview of busbars, covering their construction, function, classification, selection, and applications in high-voltage power systems. Construction and Working Principle of Busbars Busbars are constructed from conductive metal bars, typically made of copper. The first key parameter of MV switchgear is the rated continuous current of the busbar. Typical ratings include 800 A, 1250 A, 2000 A, 2500 A, 3150 A, and 4000 A. For special uses, it can go up to 5000 A.
