

The optical flow module cannot be connected to the board

Overview

Unplug it, and connect it to your autopilot. In most cases an I2C splitter should be used to allow other I2C devices (like the external RGB LED and GPS/Compass module's compass) to share the same port. The PX4FLOW (Optical Flow) Sensor is a specialized high resolution downward pointing camera module and a 3-axis gyro that uses the ground texture and visible features to determine aircraft ground velocity. Although the sensor may be supplied with a built-in Maxbotix LZ-EZ4 sonar to measure height. The image below shows an optical flow setup with a separate flow sensor (PX4Flow) and distance sensor (Lidar-Lite): An Optical Flow setup requires a downward facing camera and a downward facing distance sensor (preferably a LiDAR). These can be combined in a single product, such as the ARK Flow. After running the "make px4_fmu-v5_default" command and flashing it onto the FC, the I/O indicator light rapidly blinks red, indicating an error. We are trying to run PX4 with an optical flow sensor with position control mode without GPS. Warning: Px4Flow is supported by drone firmware version 3. It has not received support on fixed-wing or unmanned vehicles.
