

Weight of a 600mm cable tray

Overview

This tool estimates tray self-weight from material density and an approximate metal volume. For solid and perforated trays, it treats the tray as a formed sheet:
Developed sheet width per meter: $Dev = W + 2H + 2R$ Metal volume per meter: $V = Dev \times t \times 1 \times (1 - Open\%)$. Estimate cable tray self weight quickly for planning and procurement accurately. Export results instantly for schedules, submittals, and field checks. Density values are typical engineering references. In this guide, we'll walk you through the step-by-step process for calculating cable tray weight, while providing examples for both channel trays and ladder trays. Distinctive hole pattern designed to provide maximum flexibility for the installer without compromising strength. Manufactured from zinc coated. Contact EzyStrut for Load Capability information. See pages 50-51 for assembly instructions for ET Cable Tray.
