

What is a fiber optic main cable

Overview

A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The optical fiber elements are typically individually coated with plastic layers and contained in a protective tube. Unlike copper wires, which are limited by lower data transmission speeds, shorter transmission distances, and higher susceptibility to electromagnetic interference, fiber optic cables offer unparalleled performance and can cover much greater distances without bumping up against signal degradation. A fiber optic cable is a specialized cable that uses light to transmit data. A fiber-optic cable holds this string in its center, allowing light to pass through the glass. The sender device converts data into light. Light pulses transmitted through.
