

What should the output of a 116mm beam splitter be

Overview

Some require the output ports to be at 0° and 90° relative to the input beam (possibly without any beam offset of the transmitted beam), while others require two parallel outputs or some other configuration. For bulk-optical devices, a large open aperture is sometimes needed. While a beamsplitter is never lossless, it is a good approximation for most applications. Recall that the matrix elements of $B_{yij} = B_{jji}$. Beamsplitters are often classified according to their construction: cube or plate. Normally, you would want to place a beam splitter at 45 degrees with respect to the input beam. This way, it splits the light 50/50 and the output beams are aligned for sure.
