

What type of relay protection device should be used for soft starters

Overview

Semi-conductor fuses (High speed fuses) are the only type of fuses that are fast enough to achieve a fully type 2 coordination when using a soft starter. A separate overload relay for the motor protection is always required in combination with this type of fuse. If replacing the semi-conductor. DOL & REV, intelligent motorstarters and line protection components SIRIUS modular system includes: contactors, motor starter protectors, overload relays and soft starters. Size and compatibility circuit prot. IE3-motors high inrush current Inrush current is not. The question is, what can be done to obtain the highest degree of short circuit protection for motor controllers?

The solution is to use short circuit protective devices that are current-limiting and size them as close as practical. A current-limiting fuse can cut off the short-circuit current. Used by using variable speed drives. However in fixed speed applications soft starters es of the various soft start methods.

An Engineering Guide to Soft Starters

Type 2 protection requires that in the event of a short circuit on the output of a soft starter the fault must be cleared without risk of injury to personnel or damage to the soft starter.

Soft Starters

A Soft Starter is a device that starts motors with reduced power supplied at start-up. Reducing the power reduces potentially damaging electrical and mechanical shocks on the system.
