Overview

Cable termination: An ODF provides a termination point for incoming fiber optic cables. The individual fibers within the cables are terminated and connected to the corresponding ports or adapters on the ODF panel. In FTTH, FTTB, and other fiber access networks, terms such as Fiber Optic Termination Box, Fiber Distribution Box (FDB), and ODF (Optical Distribution Frame) are frequently mentioned. Although all three are related to fiber connection and management, their installation locations, functional roles. The optical fiber distribution box is to protect the connection point where the optical cable is connected to the user end, so that the optical cable access point is stable, dustproof and waterproof. What is a Fiber Termination Box in Optical Networks?

In a passive. These two connectors have four obvious similarities, such as the main functions, which can be summarized as follows: When the fixed-function optical cable enters the rack, its outer sheath and strengthening core should be mechanically fixed, ground wire protection components should be installed. Fiber-optic communication is a form of optical communication for transmitting information from one place to another by sending pulses of infrared or visible light through an optical fiber.
