

Which is the core switch port

Overview

The so-called core switch is for the network architecture. If it is a small local area network with several computers, a small switch with 8 ports can be called a core switch. The primary transmission and routing of data signals take place at the core layer only. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. They are characterized by numerous ports and high bandwidth, offering greater reliability, redundancy, throughput, and lower latency compared to access and aggregation switches. Sitting at the top of the hierarchical model, core switches interconnect distribution layer switches and provide high-speed data transfer across. The number of conventional switch ports is generally 24-48.
