Overview

Which layer is the core switch?

The core switch is the physical core layer. In actuality, there are three primary layers of a complex network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. The layer that lies between the access layer and the core layer is known as the distribution or aggregation layer, while the backbone of the network is termed the core layer. In these switches, the data routed and switched. What is Spanning Tree Protocol (STP) and why is it important in core switch networks?
