

Why do optical cable sheaths need metal straps

Overview

The stainless steel bands or straps, often referred to as cable ties or clamps, are placed around the cables and tightened using the banding tool. Bare metal, teflon tubing, or metal/teflon combinations would be recommended for use in high heat (over 70°C continuous) environments. In sensing applications, the potential of signal noise must be eliminated. Sheathings designed to be totally opaque (PVC, silicone) should be considered, and in the. According to different laying conditions of fiber optic cables, different fiber optic cable sheathing are added to the cable core to meet the mechanical protection of optical fibers under different conditions. Our state-of-the-art extrusion technology offers you the ability to utilize a large variety of plastic materials. Bonding and grounding of all metallic elements is required for all outside plant equipment including optical cables.
